

PHOTOMETRIC OBSERVATIONS OF LONG-PERIOD COMETS AT LARGE HELIOCENTRIC DISTANCES IN THE YEARS 1927 TO 1955

J. Svoreň

Astronomical Institute of the Slovak Academy of Sciences, Skalnaté Pleso Observatory, 059 60 Tatranská Lomnica, Czechoslovakia

Received 4 August 1983

ABSTRACT. This paper is a continuation of the published list of photometric observations of long-period comets and contains a list of photometric observations of 22 long-period comets which passed through perihelion in the years 1927 to 1955. In selecting the objects, two basic criteria were adopted. The first condition was that the comet had been observed at a large distance from the Sun and over a sufficient range of heliocentric distances. The second was the availability of well determined orbits which would allow to distinguish between old and new comets in Oort's sense, and to classify the photometric development according to the dynamical type of orbit. The paper contains 1176 estimates and brightness measurements of comets together with time, data on the magnitude type, type, diameter of objective and light-gathering power of the instrument used, references to literature and calculated values of heliocentric and geocentric distances, as well as the phase angles for the dates of observations.

ФОТОМЕТРИЧЕСКИЕ НАБЛЮДЕНИЯ ДОЛГО-ПЕРИОДИЧЕСКИХ КОМЕТ НА БОЛЬШИХ РАССТОЯНИЯХ ОТ СОЛНЦА В 1927-1955 ГГ. Работа является продолжением напечатанного списка фотометрических наблюдений долго-периодических комет и содержит список фотометрических наблюдений 22 долго-периодических комет, проходивших через перигелий в 1927-1955 гг. Выбор объектов был сделан применением двух точек зрения. Во-первых, за кометой должно было наблюдать на больших расстояниях от Солнца в достаточном диапазоне гелиоцентрических расстояний. Вторым кри-

терием было знание хорошо известных данных об орбитах, предоставляющих возможность различить старые и новые кометы в смысле Оорта и тоже возможную классификацию фотометрического развития в зависимости от типа орбиты. Работа приводит 1176 оценок и измерений блеска комет вместе с данными о времени, с данными о типе звездной величины, о типе, диаметре объектива и светосиле употребленного телескопа, с точными ссылками на литературу и с исчисленными гелиоцентрическими и геоцентрическими расстояниями и углами фазы для моментов наблюдений.

FOTOMETRICKÉ POZOROVANIA DLHO-PERIODICKÝCH KOMÉT VO VEĽKÝCH VZDIALENOSTIACH OD SĽNKA V OBDOBÍ ROKOV 1927 - 1955. Práca je pokračovaním publikovaného zoznamu fotometrických pozorovaní dlhoperiodických komét a obsahuje zoznam fotometrických pozorovaní 22 dlhoperiodických komét, ktoré prešli perihéliom v rokoch 1927 - 1955. Pri výbere objektov boli uplatnené dve základné hľadiská. Prvou podmienkou bolo, aby kométa bola pozorovaná vo veľkých vzdialenosťach od Slnka v dostatočnom rozsahu heliocentrických vzdialenosťí. Druhým kritériom bola znalosť dobre zaručených dráh, ktoré by umožnili rozlíšenie komét na staré a nové v zmysle Oorta a prípadnú klasifikáciu fotometrického vývoja podľa typu dráhy. Práca obsahuje 1176 odhadov a meraní jasnosti komét spolu s časovými údajmi, s údajmi o type magnitúdy, o type, priemere objektív a svetelnosti použitého prístroja, s presnými odkazmi na literatúru a vypočítanými hodnotami heliocentrických vzdialenosťí, geocentrických vzdialenosťí a fázových uhlov pre dátumy pozorovaní.

1. MATERIAL USED

The presented paper is a continuation of the list of compiled photometric observations of comets with orbits close to a parabola at large heliocentric distances, the first part of which, i.e. the observations made in 1861 - 1925, was published in the 11th volume of these contributions (Svoreň, 1983). In that paper, reasons are given for studying comets at large distances from the Sun, as well as the criteria for selecting the studied objects and all other necessary data which need not be repeated here. The list of excerpted photometric data for heliocentric distances of over 2.5 AU is supplemented by the corresponding geocentric and heliocentric distances. The orbital elements from Marsden's catalogue (1979) were used for all comets. r , Δ and the phase angle Ψ , for which

$$\Psi = \arccos \frac{r^2 + \Delta^2 - 1}{2r\Delta} \quad (1)$$

were computed using an ephemeris program written by Pittich (1975).

This paper contains second part of the collected material concerning long-period comets; others parts will be published elsewhere.

2. LIST OF PHOTOMETRIC OBSERVATIONS

The list contains exclusively data from the referenced literature which have not been supplemented in any way (e.g., with the indication of the instrument or method probably used).

The data have been arranged according to individual comets in the order of their definitive designation, the individual columns of the tables containing the following:

- N - ordinal number of observation,
- t - date of observation, the first two digits representing the last two digits of the year, the next two the month and the last two the day,
- m - apparent brightness of the comet in magnitudes,
- k - type of magnitude according to the observer's data: C - total brightness, J - brightness of photometric nucleus (central condensation). If the observer has omitted to give the type, there is no symbol in this column,
- v - method: 1 - visual, 2 - photographic, 3 - photoelectric,
- d - diameter of objective of telescope used in metres,
- f - inverse value of the light-gathering power of the telescope used,
- b - type of instrument: A - refractor, B - binoculars, C - Coudé system, D - comet-seeker, H - finder, K - short-focus camera, M - Maksutov's camera, O - naked eye, R - reflector, S - Schmidt camera,
- observer,
- l - reference. Since references to individual observations rather than to individual papers are involved, the observer and the relevant page of the paper are given in case that the autor of the paper is not the same as the observer. If the observer is also the author of the paper, the reference has the usual form, i.e. the first page of the relevant paper is given. Other exceptions are given in notes,
- r - heliocentric distance in AU,
- Δ - geocentric distance in AU,
- φ - Sun-comet-Earth phase angle in degrees.

notes: N = 19, 24-25, 30, 40, 80 - approximate brightness values, N = 33 - diameter of diaphragm 60", N = 34, 37 - diameter of diaphragm 34", N = 35, 38 - diameter of diaphragm 19", N = 36, 39 - diameter of diaphragm 11".

ACKNOWLEDGEMENTS

The autor wishes to thank Dr. L. Kresák for discussions and comments, Dr. E. M. Pittich for making his program for computing the comet ephemerides available and the staffs of the libraries of the observatories of Skalnaté Pleso, Ondřejov, Dushanbe and Warsaw for their help in locating the required literature.
