Moscow (RU) – 8 August 2014; COSPAR-14-E2.1-0001-14:

THE SCIENCE WITH FUTURE SOLAR MISSIONS, FROM THE SUN TO THE HELIOSPHERE

OUTLINE

- Hanle effect of line linear polarization by resonance scattering as diagnostics tool to probe the coronal magnetic fields
- 2010 Eclipse observations of the coronal FeXIV 530.3 nm linear polarization.
- Hanle effect interpretation and comparison with forward modeling
- Future spectro-polarimeters for ground- and space-based coronal magnetometers

Beta

Probing Coronal Magnetism with Space EUV/UV/VIR Polarimetry

Hanle Effect (tutorial)

The impact of the Hanle effect on the linear polarization produced by scattering processes

90° scattering geometry

$\odot B$

The Hanle effect **REDUCES** the amplitude of the line scattering polarization signal

(i.e., Stokes Q decreases with respect to the B=0 G case) !

The Hanle effect **ROTATES** the direction of linear polarization

(i.e., Stokes U is NON-ZERO) !

Critical Hanle field?

$$8.79 \times 10^6 g_L B(\text{gauss}) \sim 1/\text{Lifetime}$$

Magnetic splitting of the Level = Natural width of the Level

$$\omega_{\text{Larmour}} \sim A$$

Hanle Effect (tutorial)

The impact of the Hanle effect on the linear polarization produced by scattering processes

90° scattering geometry

If $\omega_{\text{Larmour}} \gg A$ (VIR forbidden lines)

~~The Hanle effect **REDUCES** the amplitude of the line scattering polarization signal (i.e., Stokes Q decreases with respect to the B=0 G case)!~~

~~The Hanle effect **ROTATES** the direction of linear polarization (i.e., Stokes U is NON-ZERO)!~~

P is // or ⊥ B

Critical Hanle field?
 $8.79 \times 10^6 g_L B(\text{gauss}) \sim 1/\text{Lifetime}$
 Magnetic splitting of the Level = Natural width of the Level
 $\omega_{\text{Larmour}} \sim A$

$\odot B$
↑

Polarization vector Van Vleck angle

Line Polarization Vector

- Linear polarization changes sign

- $3\cos^2\vartheta_V - 1 = 0$

$$(\vartheta_V = 1/\sqrt{3} = 54.7^\circ)$$

Van Vleck angle

$$\theta_V = 54.7 \text{ deg}$$

$$\Psi = \theta_V, P=0$$

$$\Psi < \theta_V, \Rightarrow \text{LP} // B$$

$$\Psi > \theta_V, \Rightarrow \text{LP} \perp B$$

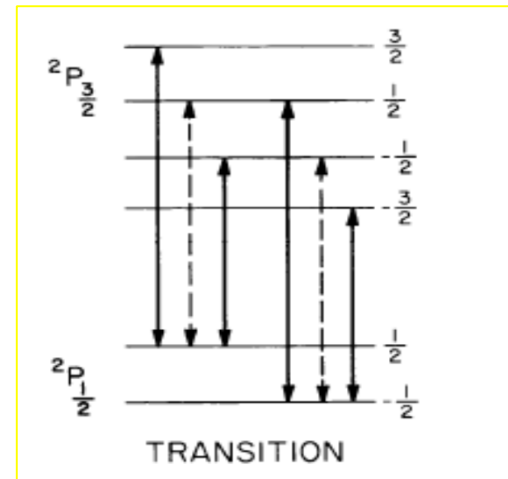

“Saturated”
Hanle effect
 $\omega_{\text{Larmour}} \gg A$

Fe XIV 530.3 nm ("Green Line")

FeXIV line 530.3 nm
 (configuration $3s^2 3p$) is a
 magnetic dipole transition:
 $2P_{3/2} \rightarrow 2P_{1/2}$

Summary

Spectro-polarimetry of coronal line-emission in the visible-light wavelength spectrum («forbidden lines») have demonstrated to yield a valuable diagnostics tool of the coronal magnetic field

- New space optics for solar physics (LC-based spectropolarimetry optics)
- New ground- and space-based observatories with visible-light spectro-polarimetry
